HAUSKEN⁺

LYDDEMPER

HAUSKEN has specialised in the **development** and **production** of high quality silencers since **1992**. The manufacturer therefore possesses more than **thirty years of experience** in sound mechanics. The silencers are crafted on state-of-the-art machinery. All parts are **hard anodized** for maximum durability. The **sophisticated engineering, precise manufacturing** and premium materials guarantee **maximised sound attenuation** with consistently **lightweight designs** and **compact dimensions**.

POWER OF STILLNESS

More accurate shots, reliable hits, humane hunting. **Because HAUSKEN.**

The benefits are plain to see. Using a silencer has the following advantages:

NOISE REDUCTION

The silencer deflects, slows down and cools the powder gases emerging from the muzzle. This prevents an abrupt relaxation of the gases, which reduces the muzzle blast.

LOW RECOIL

Besides noise reduction, ensuring a gentler recoil is the silencer's biggest benefit. The gases surging down the barrel are directed against the silencer baffles. This eases the firearm's recoil. Muzzle rise is reduced significantly as well.

IMPROVED ACCURACY

A silencer is, in principle, nothing other than a meticulously engineered, enclosed muzzle brake. Silencers also reduce turbulence that might otherwise detract from the bullet's accuracy.

NO MUZZLE FLASH

The muzzle flash is kept tucked away inside the silencer. This eliminates any burst of light when shooting in twilight or at night.

THE SOUND PRESSURE LEVEL

increases drastically (exponentially), and a reduction of just a few dB makes a big difference. The decibel (dB), as a unit of measurement, was named after Alexander Graham Bell. He developed the telephone to market maturity in the late 19th century. Decibels were initially used to quantify signal loss in a telephone connection. The unit is now used to express sound pressure levels and as a reference to sound pressure, for example in electrical devices. A sound pressure level of between 130-140 dB is described as the 'pain threshold'.

Common large-calibre hunting cartridges produce sound pressure levels of 160 dB even one metre after the muzzle. The larger the projectile diameter, the higher the measured peak sound pressure levels. In other words: a single shot can seriously damage a person's hearing, especially if they are not wearing suitable protection. Good silencers lower the sound pressure level acting on the ear to below 140 dB. This significantly reduces potential hearing damage, as the level is cut to below the pain threshold.

LET'S TALK ABOUT ...

THE TECHNICAL BACKGROUND

Agricultural machinery mechanic: He embarked on an apprenticeship in 1976 and worked at a local agricultural machinery maintenance and repair company until he started his own business in 1992. Self-employed in the servicing of agricultural and industrial machinery until 1992, he started his own company called Hausken Landbruksservice in February 1995. He also produced silencers on the side and as part of the company portfolio. Later, in 2004, he established the first company specialised in silencers, which gradually evolved into today's Hausken Lyddemper AS. He began designing and manufacturing prototype silencers for personal use in 1990.

THE HUNTING BACKGROUND

His interest in big game hunting began in 1988. Red deer have been his major passion ever since, although he occasionally hunts roe deer as well. He took out leases on numerous local hunting grounds. Active to this day, he now hunts mainly on his own land. Before switching to big game, he was a committed hunter of small game and wild birds from his early teenage years. Hunting, shooting and fishing have always interested him greatly.

FASCINATION: HUNTING

His interest began when he stopped fishing at sea. He needed a new hobby, and big game seemed like a logical progression from shooting and small game hunting. Today he is no longer quite so active as he used to be, but hunting and shooting remain natural parts of his family's life. Two of his sons-in-law are hunters, along with his oldest son. His brother is a hunter, along with many of his friends. It is a perfectly normal pastime in Norway, where people live in harmony with nature and can hunt close to their homes. He hunts for food and is equally keen to maintain a healthy local population that people can then encounter in the wild.

WHY SILENCERS?

The next logical step was to keep developing the product. With his background as a mechanic, he was accustomed to solving tricky problems – a useful skill when designing silencers. In addition, he completed his military service from 1977–78 (after he started working, so he was given 12 months' leave) and served in the Home Guard from 1980–2002. This gave him plenty of experience with firearms. He started developing silencers because he wanted one for himself and they were difficult to obtain.

H.P. Hausken

HPausken

Available silencers were heavy, added significant length to the barrel and, in his opinion, simply weren't up to the task. Driven by natural curiosity and his experience and interest in designing and making things, he started sifting through scrap metal to find the parts he needed to build his own silencer. His father Harald found it all very exciting. A bit of an inventor himself, he encouraged HP and helped him to build the first prototypes.

THE FIRST STEPS TO SUCCESS

The very first silencer was made of steel. The engineer welded various elements together to see if it was possible to build a functioning silencer with a rear expansion chamber that was not prohibitively long. Although too heavy, the silencer did work and therefore provided the proof of concept. He procured an aluminium core and tube and built a prototype. Shortly afterwards, he made the logical decision to drill perforations into the core, following the same pattern that is still found in today's HAUSKEN silencers.

THE XTRM ADD-ON

After a few attempts, HP eventually found a design he was happy with. He then added a steel mesh and used it for hunting. The master was highly satisfied with his work – and with its effects. Even the first standard model ensured a very pleasing reduction in both noise and recoil. Additional integration of a steel mesh greatly improved attenuation and delivered a quite audible difference in the shot discharge. And the combination of aluminium and steel was still light and easy to handle. HP finally sent the innovative device to a Norwegian hunting journalist, Jørund Lien, for review and received a good rating. This encouraged HP, and he soon realised that there was a market, albeit a limited one.

WHAT IS HIS PERSONAL VIEW OF SILENCERS AND THEIR USE?

HP is particularly pleased with the versatile JAKT series. All his work and experience has created an outstanding product that is engineered as simply as possible, made of suitable materials and does the job for which it was designed. Firstly his silencer protects the shooter's hearing and secondly brings more stability and calm to the whole shooting experience.

SILENCERS

SILENCERS use a variety of principles that affect muzzle blast in several stages. On the one hand, gas pressure is relieved and the temperature lowered. The internal design also creates turbulence in the flow of gas. On the other hand, the add-on reduces the velocity of the gas flow, ultimately modulating the shot's frequency. The aim in this regard is to reduce the gas pressure at the muzzle and the gas pressure level. So silencers definitely involve a lot of physics. The device must be able to withstand the pressure, high temperatures and pulses at all times. For this reason, they are generally crafted from metals or metals with corrosion-resistant special alloys. Steel, aluminium and titanium have proven particularly durable in a market comparison, depending on the intended use.

THE DESIGN PRINCIPLE for a silencer is based on a tube. It is attached close to the muzzle using a special thread or slipped over the barrel. There is a bore to allow the bullet to pass at the opposite 'exit end'. The purpose of the silencer body volume is to lower the gas pressure – because the higher the volume of the tube, the more the gases will expand inside. Generally speaking, silencers are twenty to thirty times longer than the cartridge calibre. The diameter is around two to five times wider. The bore diameter at the exit bore should be 1.25 times the bullet calibre.

THE SERVICE LIFE of silencers is difficult to predict. It depends on a wide variety of factors such as material, muzzle pressure, the use of cartridges that produce high gas pressure, design and frequency of fast bursts of fire; all these factors may affect the service life. Significant strain on the baffles and high temperatures will usually expose the silencer to considerable stress. Aluminium models will have a service life of many hundred to several thousand shots, depending on the preferences and behaviour of the hunter or athlete.

ON-BARREL: simpler designs, in which the silencer is attached to the end of the barrel using a thread, adding to its overall length. This shifts the firearm's centre of gravity forwards, which is beneficial with shorter barrels. The total length increases considerably. But the clear advantage is simple mounting, provided the thread size is adapted with foresight. In addition, open sights can remain mounted in most cases.

OVER-BARREL: they have a more elaborate design and are, as it were, slipped over the barrel. The increase in the firearm's total length is therefore less pronounced compared to on-barrel models. Only part of the silencer is in front of the muzzle. In these models, suitable baffles divert a substantial part of the gas flow exiting the muzzle back to an expansion chamber enclosing the barrel.

WHEN SELECTING a silencer, it is important to try and maintain a short to moderate protrusion beyond the end of the barrel. The larger the protrusion, the further the exit bore – as the source of the muzzle blast – will be from the shooter's ear. But the silencer should not be slipped too far over the firearm, as this impairs its function and handling, for instance because expansion takes place too close to the shooter's ear. Striking a good balance is therefore imperative.

PLEASE NOTE: Silencers may only be mounted on firearms if the exit bores are large enough for the calibre. To keep noise as low as possible, it is advisable to select cartridges that combine the smallest possible bullet diameter (= smaller exit bore) with the smallest possible case volume.

HAUSKEN XTRM MESH

The HAUSKEN steel mesh that is wrapped around the core reduces the muzzle blast by another 3-7 dB.

JAKT WHISPER XTRM (WD60X)

The **XTRM** steel mesh also guarantees significantly greater sound attenuation. The human ear perceives a change in sound pressure level by 6 dB as either twice or half as loud.

JAKT

FOR VERSATILE HUNTING

JAKT JD224

Quiet, light, compact! Maximum attenuation and functionality, combined with **handy dimensions**. The **HAUSKEN JD224** ticks these boxes with its just **50 mm** diameter and a weight of only **300 g**.

Optimised with an additional **XTRM steel mesh**, the **JD224X TRM** catches the eye with its **improved attenuation of 3–7 dB**. Here as well, the **over-barrel design** extends the firearm by just 14 cm. Weighing just **380 g**, this lightweight silencer is also suitable for **magnum calibres** and **faster burst of fire** thanks to its **high-alloy aluminium** and successful combination with the **XTRM steel mesh**.

JAKT JD224 MKII

Attenuation	approx. 34+ dB

A PERSONAL TOUCH

JAKT: The **lightest** and **most innovative over-barrel** silencer, designed specifically for all **hunting scenarios** around the world. The **weight, length** and **effectiveness** of these models are ideally coordinated and perfectly matched with the needs of active hunters. Equipped with hard anodised **inner and outer tubes**, JAKT silencers are **especially durable**. The diameter of 50 mm achieves balanced silencing of up to **-34 dB**, while the rifle remains accurate and unbeatably easy to handle even when in motion. JAKT series models are available in a **variety of colours** to add a **personal touch** and **contemporary look**. Some models (JD151-224) come with additional **optional extras** to maximise personal effectiveness and experience.

JAKT JD151-224 silencers are **not suitable for guns with open sights**. The **maximum permissible external barrel diameter is 23 mm**. The sound pressure level reduction is between **25 and approx. 40 dB**, depending on the total length of the device.

XTRM

WITH THE ADDED XTRM ATTENUATION

All COLOURED JAKT SILENCERS are also available ex works with the **XTRM steel mesh (JD151-224X)**. The XTRM system guarantees **reductions in sound in pressure levels by an additional 3-7 dB**. This is important, as a change in **sound pressure level of 6-10 dB is perceived as twice as loud or quiet!** By selecting a HAUSKEN XTRM variant, shooters can significantly protect their **own hearing**, as well as the hearing of an **accompanying dog and the entire hunting community**.

THE RIGHT LENGTH...

The **ultra-compact silencer** by HAUSKEN. First choice for **small arms** and **dog handlers**: The HAUSKEN **JAKT JD151 XTRM** is Hausken's most compact over-barrel silencer for **standard calibres**. The short **additional length of just 67 mm** makes this suppressor the **best option** for people who need to keep their firearms as agile as possible, even with a silencer fitted. Its **low weight** and **discrete extension** keeps the gun finely **balanced**. These are **crucial factors** for **lightweight rifles** in particular. The silencer is **not suitable for guns with open sights**. Maximum external barrel diameter **23 mm**.

JAKT JD151 MKII

Total length 151 mm
External Ø 50 mm
Thread 18 x 1
Max. Bullet Ø up to .375 (9.5 mm)
Attenuation approx. 23+ dB

JAKT JD151 XTRM MKII

Total length 151 mm
External Ø 50 mm
Thread 18 x 1
Max. Bullet Ø up to .375 (9.5 mm)
Attenuation approx. 25+ dB

...FOR AN UNBEATABLE EFFECT

JAKT JD184 MKII

With its **over-barrel design**, the **HAUSKEN JAKT JD184** lengthens the firearm by only around **10 cm**. The JAKT JD184 delivers the **perfect balance** of attenuation, **weight and simple handling**. The silencer is **not suitable for guns with open sights**. Maximum external barrel diameter **23 mm**.

JAKT JD184 MKII

Total length	184 mm
External Ø	50 mm
Thread	18 x 1
Max. Bullet Ø	up to .375 (9.5 mm)
Attenuation	approx. 27+ dB

JAKT JD184 XTRM MKII

Total length	184 mm
External Ø	50 mm
Thread	18 x 1
Max. Bullet Ø	up to .375 (9.5 mm)
Attenuation	approx. 31+ dB

COMPACT TECHNOLOGY

FOR GUNS WITH OPEN SIGHTS

JAKT SK156

The **JAKT SUPER KOMPAKT** on-barrel silencer variant in the JAKT series enables you **to leave open sights** mounted on the long gun. So that you can remain **focused on what really matters**. **Six pressure distribution chambers** in front of the muzzle ensure excellent **attenuation of up to -29 dB** and **protect the shooter's hearing** and the hearing of their **companion** and an **accompanying dog** for **long-lasting success**. All of this with an **insignificant rifle extension** of just 156 mm.

JAKT SK156 MKII

Total length 156 mm
External Ø 50 mm
Thread 18 x 1
Max. Bullet Ø up to .375 (9.5 mm)
Attenuation approx. 28+ dB

JAKT SK156 XTRM MKII

Total length 156 mm
External Ø 50 mm
Thread 18 x 1
Max. Bullet Ø up to .375 (9.5 mm)
Attenuation approx. 29+ dB

PERFECT SYNERGY

OPTIMISED ATTENUATION

JAKT WD60

JAKT WHISPER is a **perfect symbiosis** of the **extremely popular and high-performance designs** – as **robust** as it is **agile**. The larger diameter of 60 mm, the low weight, the **over-barrel design** and the additional volume enable excellent, **enhanced effectiveness** of **up to -38 dB**. The design does not obstruct the scope. Hard anodised inner and outer tubes for outstanding durability. Suitable for rifles with a barrel diameter of up to 23 mm. **Six pressure distribution chambers** and the additional expansion chamber ensure **even pressure distribution** inside, therefore **eliminating muzzle flash from the shooting experience**. The perfect solution for all hunting scenarios, **even over longer distances**.

JAKT WD60 MKII

Total length	224 mm
External Ø	60 mm
Thread	18 x 1
Max. Bullet Ø	up to .375 (9.5 mm)
Attenuation	approx. 35+ dB

JAKT WD60 XTRM MKII

WHISPER XTRM

THE IDEAL BLEND OF FIREARM ENHANCEMENT
AND SOUND ATTENUATION

WHISPER WD406 XTRM

With a **diameter of 70 mm** and **six different lengths** from **228-506 mm**, the **WHISPER over-barrel** models deliver excellent attenuation of **up to -40 dB**. They are specifically engineering for **shooting over longer distances**. These models have sufficient space for **rifles with a barrel diameter of up to 30 mm**. The WHISPER series represents the **robust compromise** between extreme attenuation and – compared to the WHISPER MEGA XTRM – **less rifle extension of just 144 mm!**

PRODUCT LINE VARIANTS WD228X, WD306X, WD365X, WD406X, WD456X, WD506X

WHISPER XTRM WD228-506X MKII

Total length from 228 mm - 506 mm
External Ø 70 mm
Thread 24 x 1
Max. bullet Ø up to .375 (9.5 mm)
Attenuation approx. 37+ - 40+ dB*

MEGA XTRM

FOR LONG DISTANCES AND STRONG PERFORMANCES

WHISPER WX606 MEGA XTRM

MEGA XTRM is an **upgrade of the WHISPER series**. With a **continuous steel mesh lining** in the twelve attenuation chambers, a **generous diameter of 70 mm**, **five total lengths** of 456-656 mm and pressure distribution chambers with a length of almost 300 mm in front of the muzzle, this design achieves **unparalleled attenuation** of up to **-43 dB**. Which absolutely justifies its powerful name: WHISPER MEGA XTRM. The **MEGA XTRM absorbs virtually all the noise** from the muzzle blast. This silencer is a **highly robust and durable silencer** which **tames even the heaviest magnum calibres** and is ideal for **absolutely accurate shooting, even at long ranges**.

PRODUCT LINE VARIANTS WX456, WX506, WX556, WX606, WX656

WHISPER MEGA XTRM WX456-656 MKII

Total length	from 456 mm - 656 mm
External Ø	70 mm
Thread	24 x 1
Max. Bullet Ø	up to .375 (9.5 mm)
Attenuation	approx. 41+ - 40+ dB*

MINI AND EFFICIENT

SMALL AND EFFICIENT ON-BARREL DESIGN

MINI (MD)

SMALL BUT EFFICIENT

With its diameters of **35 and 45 mm**, the MINI series is the smallest in HAUSKEN's portfolio of high-quality silencers. The **on-barrel design** for **open sights**, the compact and **lightweight engineering** make them **efficient companions**, even for very active use-cases. Despite the **minimal barrel extension of just 128 mm**, shooters benefit from a significantly reduced **muzzle blast volume of more than -22 dB**. Improved accuracy and a **high-quality technical experience are therefore guaranteed**. Protect Shield your ears and the hearing of your hunting team from painful noise levels.

RWS QUICK SLEEVE BY NIGGELOH®

Silencers quickly **heat up due to the rapid rate of fire**. This produces a **mirage**, which can impede **target acquisition**.

The **Cordura®-reinforced upper surface** on the **RWS QUICK SLEEVE** dissipates the heat to the side and keeps **your view of the target clear**. The high-quality **neoprene prevents damage** to the silencer and **reduces the noise** when bumping against the hunting pulpit or when tracking. What's more, the **shot blast is reduced by up to 3 dB** (varies depending on the silencer).

- Our perception of noise is caused by sound pressure acting on the eardrum.
- The sound pressure level (dB) is expressed relative to sound pressure (Pa) and makes it easier to understand the otherwise very large numbers associated with sound pressure.
- An increase in sound pressure level by just 20 dB means a tenfold increase in sound pressure. The sound pressure levels produced by a gunshot are harmful and can cause significant hearing loss. Sound pressure levels and sound pressure tend to rise with the size of the calibre.
- A change in sound pressure level of 6-10 dB is perceived as twice as loud or quiet. However, our perception of volume is a psychoacoustic variable and therefore subjective. In other words, it depends on a large number of environmental and personal factors.
- The shot blast consists of various components, in which the muzzle blast and sonic boom of the bullet in flight are the predominant factors.
- Without hearing protection, even a single shot discharged nearby can cause significant and irreparable damage to the inner ear.
- Generally speaking, silencers reduce the sound pressure level acting on the ear to below 140 dB.
- The sonic boom caused by the bullet is not affected by the bullet's progression through the silencer and in the air.
- Significantly reducing the muzzle blast makes it more difficult to localise the hunter. But the shot is still loud and is clearly audible from the front.
- A silenced shot is definitely not a harmless 'plop'. - Silencers reduce the muzzle blast and protect the hearing of the hunter and the accompanying dog. They enable the hunter to hear the bullet impact.
- Using a silencer ensures a gentler recoil. This reduces the likelihood of flinching and improves accuracy. The shooter experiences far less destabilisation and can maintain a calmer stance. Using a silencer therefore consistently minimises the risk of jerking a shot.
- Enabling cleaner hits contributes to more humane hunting. The game is taken down more cleanly, accurately and efficiently.
- Silencers eliminate the muzzle flash. It becomes easier to spot the outlines of the game, especially in the dark, which relieves the strain on the hunter's eyes. Protective reflexes are reduced, so that the hunter does not instinctively squint after firing. It is then easier to notice the shot impact, providing important information in the event it is necessary to search for the game.

IN PRACTICE

CLEANING, CARE & HANDLING

BASIC CLEANING

The silencer should be dismantled for cleaning using the HAUSKEN stripping tool. We recommend using the FlunaTec Silencer Kit for basic cleaning. The special cleaner and degreaser cleans automatically without leaving residues. It is easy to use and produces a convincing result without harming the material. Before reassembly, the silencer must be thoroughly dried and the thread on the baffle tube as well as the seals must be lubricated with a heat-resistant grease or with Fluna Gun Coating.

CARE

USING OIL AND LUBRICANT

A thin coat of heat-resistant oil or grease should always be applied to the muzzle thread. Fluna Gun Coating is the best choice for this (heat resistant up to +750°C). Without this lubricant film, the silencer can become 'baked onto' the firearm, and you may be unable to release it without causing considerable damage.

UNSCREW & AIR

It is important to unscrew the silencer from the firearm and ensure thorough airing after each hunt. The smoke residue remaining in the silencer may otherwise react with condensation to form acid. This acid can damage the silencer and the firearm.

PRACTICAL TIP:

Place the silencer on a radiator or similar source of heat for a while after each use. This produces a chimney effect that encourages fast drying. Alternatively, a hair dryer can also be used on the silencer – but please note that this method may cause burning.

RECOMMENDED:

Perform basic cleaning once a year or after approx. 200 shots. You can do it yourself or bring the firearm to your gunsmith.

HAUSKEN

LYDDEMPER

All HAUSKEN products are available from specialist dealers. Current laws (Weapons Act and Hunting Act) on the purchase, possession and use of silencers must be complied with. We reserve the right to make technical modifications to the products described and shown here without prior announcement. Errors and printing errors reserved. We do not accept liability for the information provided herein. Photocopies and reprints are only permitted with the written permission.
