

Malcolm Grendon is the manager of GMK's workshop and during the year he handles hundreds of rifles and shotguns sent for repair or service. According to Malcolm, although some of the work arises from accidents and mishaps, some of it could be easily avoided if owners took a few precautions in the form of simple maintenance and care. So if you want to keep clear of a potentially expensive introduction to Malcolm and his team take heed!

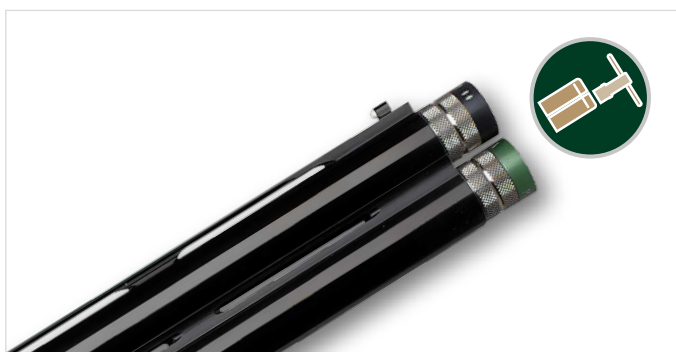

The hinge area of the action which facilitates the opening of the barrels is called the knuckle. A simple, light, application of oil each time the gun is used will prevent the scoring that will otherwise occur, eventually leading to real difficulty opening and closing the gun.

Guns are not waterproof... Time and again owners will, after a day's shooting or at the end of the season, put their guns away wet, and time and again they will experience problems with rust. Drying the gun and apply gun oil to the barrels and action will stop any possibility of rust damage.

Exposure to wet conditions will cause the stock to expand or heave resulting in splitting. All that's needed is to dry off the weapon fully and every so often apply a little conditioning oil (available from all retailers) to the stock. We recommend to apply oil after purchase).

Keeping your multi-chokes clean is essential. Frequently these are left on the gun dirty. Eventually they become corroded in place with expensive consequences. They should be removed, cleaned and oiled and slightly loosened when the gun is put away, but don't forget to tighten them up again before use. The same rules also apply if your rifle is fitted with a sound moderator.
